What are the types of the Sharepod.exe file? The Sharepod.exe file is one of the many Sharepod executable files that are a part of the Sharepod software program. Search.exe is a program file that Microsoft Windows uses to search for new and missing files or programs. The Search.exe program allows users to quickly search for files or programs using its built-in search engine.

Search.exe is an integral part of the Windows operating system. Search.exe runs in the C:\Windows\system32\search.exe location in the system. Search.exe program is owned by the Windows operating system. The effect of sex hormone use on recovery from acute pulmonary embolism: a multicentre cohort study. Most studies evaluating the effects of sex hormones on pulmonary embolism (PE) have included women with different hormonal status. The aim of this study was to evaluate the effect of sex hormones on PE-related hospitalization and mortality in men and women. A retrospective cohort study was conducted in seven academic and one community hospitals in the Netherlands, involving 5,173 patients with a diagnosis of acute PE. The primary outcome measures were hospitalization and in-hospital mortality. Patients were divided into hormone-use and non-use groups. All patients with hormone use at least two months prior to the index admission were excluded. Women with hormone use within two months before index admission were also excluded. In all, 1,184 patients with PE were included. In-hospital mortality was 4.4% and hospitalization was required in 24.8% of the cohort. In-hospital mortality was lower in women receiving hormone therapy (HT) compared to non-HT (2.3% vs 6.8%, respectively; $p=0.019$). A similar trend was seen for women receiving HT at least two months prior to the index admission (1.4% vs 5.6%, respectively; $p=0.082$). In men receiving HT, in-hospital mortality was 3.5% compared to 4.5% in men not receiving HT ($p=0.564$). In patients without HT, hospitalization was higher in men compared to women (27.4% vs 21.8%, respectively; $p=0.031$). Compared to non-HT, HT in men was associated with lower hospitalization (26.2% vs. 37.6%; $p=0.001$). Hormone therapy was associated with a trend towards lower in-hospital mortality 82157476af
